

## **How to connect to the Aeolus scheduler**

The Aeolus Scheduler comprises of a scheduler and a client. Java Virtual Machine 1.6 is required in order to run the client using the graphical user interface, while access to the AEOLUS testbed is necessary in order to run the scheduler. The compressed file containing the source is organized in three folders, scheduler, lib, and client.

### **Lib**

This folder contains the necessary files required by the client and contains JXTA files and jars related to the graphical user interface.

### **Client**

The client runs as a standalone application. By running the comp.bat file, the source code is compiled; again, the correct path to the javac compiler should be edited in the .bat file. The run.bat file is responsible for running the GUI client. Once the GUI appears, the user can view the available schedulers, connect to one of them and execute the protocol.
